Well to be able to utilize this app you just need to have a device with the capability of Wi-Fi tethering or laptop that supports Wi-Fi connectivity. So do we have to have or connect with Wi-Fi? And what if we don't have it? Calm down, you don't have to have a Wi-Fi router, MiFi, or something to be able to use this application (except for Windows Phone). Well rather than spend too much time width of more is better we directly talk about how to use it yuk! But first you need to install this app on your device:

Suck here for the device your Laptop, lipo in the Google PlayStore for Android devices, WP Store for Windows Phone devices, or App Store for iOS devices.

NOTE: If you do not know how to install android apps via PC/Laptop please read the article How to install apps on android through computer.

Well if you already install this app on each your device, you can begin to open the app ShareIt on both devices you want to use to exchange files. Here, mimin would divide it into 3 parts, because the way to send data using apps is slightly different on some devices. We begin part the first :

Data Transfer From Smartphone to Smartphone

We assume that you will send files/data from phone A (the sender) to phone B (the recipient). Open the app ShareIt in each device, and the display will appear like this :

Send
Receive
